Elasticsearch Email Load

You should download these files:

- https://www.pg4e.com/code/elasticmail.py (https://www.pg4e.com/code/elasticmail.py?PHPSESSID=f14b4ee781939e24a60d0e11bd23bf42)
- https://www.pg4e.com/code/datecompat.py (https://www.pg4e.com/code/datecompat.py?PHPSESSID=f14b4ee781939e24a60d0e11bd23bf42)

You will need to install the Python Elasticsearch library (version 7.13.x) if you have not already done so.

```
pip install 'elasticsearch<7.14.0'
```

If installing elasticsearch locally run **pip** with the **-m** flag enabled:

```
macOS: python3 -m pip install 'elasticsearch<7.14.0'
```

```
Windows: python -m pip install 'elasticsearch<7.14.0'
```

```
Host: www.pg4e.com
Scheme: https
Prefix: elasticsearch
Port: 443
Account: pg4e_82e078b4f8
Password:   (hide/show copy)
```

Check Answer

The autograder will run a query that looks for data from the emails has been successfully inserted into rows in the Elasticsearch index.

Optionally, but not required by the autograder, feel free to paste your Python code in the space below the assignment to share with reviewers.

You must clear out your index and load at least the first 100 messages from http://mbox.dr-chuck.net/sakai.devel/ (http://mbox.dr-chuck.net/sakai.devel/) into the index to complete this assignment. You should not need to change any code to make this happen. This is example code you can refer to in the future of pulling data from an API and pushing it into Elasticsearch.

Please enter your Python code here:
