Done

Elasticsearch Tweets

In this assignment you will create an Elasticsearch index in the following Elasticsearch instance:

```
Host: www.pg4e.com
Scheme: https
Prefix: elasticsearch
Port: 443
Account: pg4e_82e078b4f8
Password:   (hide/show copy)
```

Check Answer

Please enter your Python code in the space below the assignment instructions.

The index name should be the same as your user name and you should drop the index before you insert the following "tweets" (The author and date can be anything):

```
Now at this point in our discussion of compilers and interpreters you
should be wondering a bit about the Python interpreter itself What
language is it written in Is it written in a compiled language When we
type python what exactly is happening
The Python interpreter is written in a highlevel language called C
```

Yes, the above lines do not look like tweets :) They are randomly generated and as such pretty bad tweets but they are the text you are to use for this assignment.

You should download these files:

- https://www.pg4e.com/code/elastictweet.py (https://www.pg4e.com/code/elastictweet.py?PHPSESSID=fdd6908b82ace559a6c20b7017a32b26)
- https://www.pg4e.com/code/hidden-dist.py (https://www.pg4e.com/code/hidden-dist.py?PHPSESSID=fdd6908b82ace559a6c20b7017a32b26)

Then copy **hidden-dist.py** to **hidden.py** and put your Elasticsearch host/prefix/port/account/password values into the **elastic()** method. You should also put your PostgreSQL secrets into this file as well.

You will need to install the Python Elasticsearch library (version 7.13.x) if you have not already done so.

```
pip install 'elasticsearch<7.14.0'
```

If installing elasticsearch locally run **pip** with the **-m** flag enabled:

Done

```
macOS: python3 -m pip install 'elasticsearch<7.14.0'
```

```
Windows: python -m pip install 'elasticsearch<7.14.0'
```

The goal of this assignment is to loop through the automatically generated tweets above and index them as documents in your Elasticsearch index with tweet text stored in the field `text`. See the file `elasticbook.py` for some hints and inspiration for how to accomplish this.

This autograder will run a command equivalent to using the **elastictool.py** command as follows, but will be looking for words or phrases from your automatically generated "tweets" above:

```
$ python3 elastictool.py
Done
Enter command: search bonsai
https://pg4e_dca2724d69:*****@www.pg4e.com:443/elasticsearch/pg4e_dca2724d69/_search?pretty
{"query": {"query_string": {"query": "bonsai"}}}
200
{
  "took": 1,
  "timed_out": false,
  "_shards": {
    "total": 1,
    "successful": 1,
    "skipped": 0,
    "failed": 0
  },
  "hits": {
    "total": {
      "value": 1,
      "relation": "eq"
    },
    "max_score": 0.2876821,
    "hits": [
      {
        "_index": "pg4e_dca2724d69",
        "_type": "_doc",
        "_id": "abc",
        "_score": 0.2876821,
        "_source": {
          "author": "kimchy",
          "type": "tweet",
          "text": "Elasticsearch: cool. bonsai cool.",
          "timestamp": "2021-02-02T17:18:08.166157"
        }
      }
    ]
  }
}
```

And expect to get at least one hit.

You can download the code for **elastictool.py** at https://www.pg4e.com/code/elastictool.py (https://www.pg4e.com/code/elastictool.py?PHPSESSID=fdd6908b82ace559a6c20b7017a32b26). This depends on having the account values in **hidden.py**.

Please enter your Python code here:
