# Reverse Index in SQL

In this assignment, you will create a table of documents and then produce a reverse index for those documents that identifies each document which contains a particular word using SQL.

FYI: In *contrast* with the provided sample SQL, you will map all the words in the reverse index to lower case (i.e. Python, PYTHON, and python should all end up as "python" in the inverted index).

Connection Details:

Host: pg.pg4e.com

Port: 5432

Database: pg4e_402ae32925

User: pg4e_402ae32925

Password: (hide/show copy)

Check Answer

Here is the the **psql** command to access your database:

```
psql -h pg.pg4e.com -p 5432 -U pg4e_402ae32925 pg4e_402ae32925
```

```
CREATE TABLE docs01 (id SERIAL, doc TEXT, PRIMARY KEY(id));

CREATE TABLE invert01 (
  keyword TEXT,
  doc_id INTEGER REFERENCES docs01(id) ON DELETE CASCADE
);
```

Here are the one-line documents that you are to insert into **docs01**:

```
INSERT INTO docs01 (doc) VALUES
('should be wondering a bit about the Python interpreter itself What'),
('language is it written in Is it written in a compiled language When we'),
('type python what exactly is happening'),
('The Python interpreter is written in a highlevel language called C'),
('You can look at the actual source code for the Python interpreter by'),
('source code So Python is a program itself and it is compiled into'),
('machine code When you installed Python on your computer or the vendor'),
('installed it you copied a machinecode copy of the translated Python'),
('program onto your system In Windows the executable machine code for'),
('Python itself is likely in a file with a name like');
```

Done

Here is a sample for the first few expected rows of your reverse index:

```
SELECT keyword, doc_id FROM invert01 ORDER BY keyword, doc_id LIMIT 10;

keyword    |  doc_id
-----------+--------
a          |    1
a          |    2
a          |    4
a          |    6
a          |    8
a          |    10
about      |    1
actual     |    5
and        |    6
at         |    5
```
