Creating database...

Database created.

Initial Database Setup

You will need access to a database to use for this course. This tool creates your database and gives you an account and password to use to connect to the database.

```
Host:     pg.pg4e.com
Port:     5432
Database: pg4e_3774c65c52
User:     pg4e_3774c65c52
Password: pg4e_p_ee69a18fc79364f (hide/show copy)

psql -h pg.pg4e.com -p 5432 -U pg4e_3774c65c52 pg4e_3774c65c52
```

Current database size 7829 kB

Your database may be deleted if it gets too large or it has not been used for while. If your database is deleted, you can come back to this tool to re-create your database.

You will see a **pg4e_meta** table in your database that is used internally by the autograder to pass information from one assignment to another assignment. The autograder will store mysterious stuff in this table and look at it later. Leave this table alone. If this table does not exist or you change the data the autograder puts in this table, the autograder may refuse to grade your assignments, or your database may be deleted as part of a maintenance process.

Technical Detail on Your Database

This database is on a shared instance of PostgreSQL. You have enough access to your database to do the homework for this class, but will not have access to some of the server-wide database wide tables that contain data about the other users on the server. This can cause PostgreSQL clients to complain with errors like the following when they try to access these server-wide databases and schemas:

```
ERROR: permission denied for view pg_roles
ERROR: permission denied for pg_database
```

In a real production environment, you (or someone) will have a access to the all-powerful **postgres** account and most accounts have at least read-access to these cross-database tables.
