Done

Using SELECT DISTINCT

In this assignment you are to find the distinct values in the **state** column of the **taxdata** table in ascending order. Your query should only return these five rows (i.e. inclide a LIMIT clause):

```
AE
AK
AL
AP
AR
```

Enter SQL here...

Submit Query

Here are access details for a readonly database:

```
Host: pg.pg4e.com
Port: 5432
Database: readonly
User: readonly
Password:   (hide/show copy)

psql -h pg.pg4e.com -p 5432 -U readonly readonly
```

Here is the schema for the **taxdata** table:

```
readonly=# \d+ taxdata
  Column  |          Type          |
----------+------------------------+
 id       | integer                |
 ein      | integer                |
 name     | character varying(255) |
 year     | integer                |
 revenue  | bigint                 |
 expenses | bigint                 |
 purpose  | text                   |
 ptid     | character varying(255) |
 ptname   | character varying(255) |
 city     | character varying(255) |
 state    | character varying(255) |
 url      | character varying(255) |
```
